Work done to the go-kart

This past week, the majority of the wires were routed in automotive conduit and zip tied to the chassis of the vehicle safely out of the way. The speed controllers were mounted. Wires that were long were clipped to make routing easier and to help clean up. Wires were attached to the brake and gas pedal potentiometers.

Figure 1: routed wires and wire bundles for the gas and brake pedals
Future Work:

Design the PCB and mount any remaining electronics. Route the rest of the wires after purchasing more conduit.
